

USW 100 – remote connection facility

This system enables the hose connection point and controls enclosure to be fitted up to 20m from the underground installation. The controls and hose tap are mounted on a wall and require piping and power connections to be made to the pump via the service duct to the inlet chamber. The controls enclosure is waterproof, enabling it to be mounted in a convenient location on an external wall.

Above ground supply pipes must be suitably insulated to protect against freezing in cold weather.
